

FEATURES AT A GLANCE

- Full range of multimedia services—voice, video, and data
- Universally accessible over standard broadband lines
- Exceptional quality, reliability, and security
- Fully supported, customizable, and brandable
- Enables profitable delivery of IP multimedia services—today

GATELINX COMMUNICATOR™

A brandable IP multimedia application that delivers all the capabilities of interactive voice, video, and data communications in an easy-to-use interface

Retaining customers and creating new revenue requires the delivery of ever new and innovative services that are easy to market and deploy, yet don't sap profits by requiring significant capital expenditures. One of the most exciting opportunities on the horizon for IP communications providers and integrators is the promise of new and profitable IP multimedia communications services—interactive voice, video and data—that deliver next-generation functionality over existing broadband infrastructures. However, delivering multimedia over IP typically requires substantial infrastructure investment to adequately provision for Quality of Service (QoS), growth, and security requirements.

A BREAK-THROUGH MULTIMEDIA OVER IP APPLICATION

Gatelinx Communicator™ is an innovative IP multimedia application that overcomes the QoS, bandwidth, latency, and security issues that limit entry into the multimedia over IP market. Available as a simple software download, Communicator offers an intuitive user interface that brings all the capabilities of multimedia communications directly to your customers, including interactive audio/video, application sharing, text chat, file transfer, media streaming, and even multi-party calling, over a standard broadband connection.

Communicator is completely customizable in feature and form, ready to be branded and delivered to any customer or device you choose for universal access and broad appeal. Now you can retain customers and create new revenue streams with an affordable, easy to deploy IP multimedia application that leverages your existing IP infrastructure to enable profitable new services.

Communicator's superb quality and robust feature set are powered by Gatelinx' enabling technology. Gatelinx deploys a thin software client over standard TCP called the Gatelinx Managed Universal Services Transport™ (MUST™) and integrates it with powerful load balancing capabilities. The resulting "enhanced" TCP resolves the existing problems encountered when delivering multimedia services over IP by requiring far less bandwidth between connections and by intelligently controlling packet loss and jitter. This industry break-through allows you to deliver low-cost multimedia solutions that provide QoS-like performance without the expense of a QoS-enabled network.

DELIVER PROFITABLE IP MULTIMEDIA SERVICES WITH FLEXIBLE FEATURE SETS

Gatelinx Communicator integrates easily with your existing applications for quick adoption and delivery to your customers. And because Communicator is deployed over standard broadband connections, you won't diminish your profit potential through additional capital outlays.

Communicator is offered in two editions that allow you to flexibly provision the capabilities that are most relevant to your customers:

COMMUNICATOR CONSUMER EDITION

Communicator Consumer Edition's capabilities can be easily branded and delivered to your existing customers for fast return on investment, and include these integrated features:

- **Live Audio/Video/Avatar** - truly interactive two-way voice and video communications that enable spontaneous meetings and discussions, supported with an optional video Avatar, a life-like 3-D image that can speak and show emotions while delivering live audio.
- **Text Chat** - instant messaging capabilities to support live audio and video conversations.
- **Optional Media Streamer** - enables the synchronized two-way delivery of high-quality streamed video and audio files with the click of a button.

COMMUNICATOR ENTERPRISE EDITION

Communicator's Enterprise Edition offers additional multimedia functionality not included in the Consumer Edition that enables greater efficiency and productivity for your enterprise customers. In addition to Live Audio/Video/Avatar and Text Chat, Enterprise Edition also includes:

- **File Transfer** - send and receive mission-critical files and content over the same IP connection.
- **Application Sharing** - actively collaborate on the same applications at the same time with shared control.
- **Optional Multi-Party Calling** - bring up to eight participants into one Gatelinx Communicator call for the ultimate in collaboration and communication.
- **Optional Media Streamer** - two-way delivery of streamed video and audio files can enhance marketing, sales, training—virtually every part of the business process.

All editions of Communicator include the Gatelinx Enterprise Manager, an administrative toolset that provides instant visibility into the application, enabling call management and tracking of business rules, billing, and usage models. You'll have the information you need to efficiently deploy and cost-effectively deliver Communicator for maximum profit potential.

Communicator can also be upgraded to provide a high-resolution mode—equivalent in quality to enhanced definition TV—to support critical business, medical, or industrial applications that require advanced video quality.

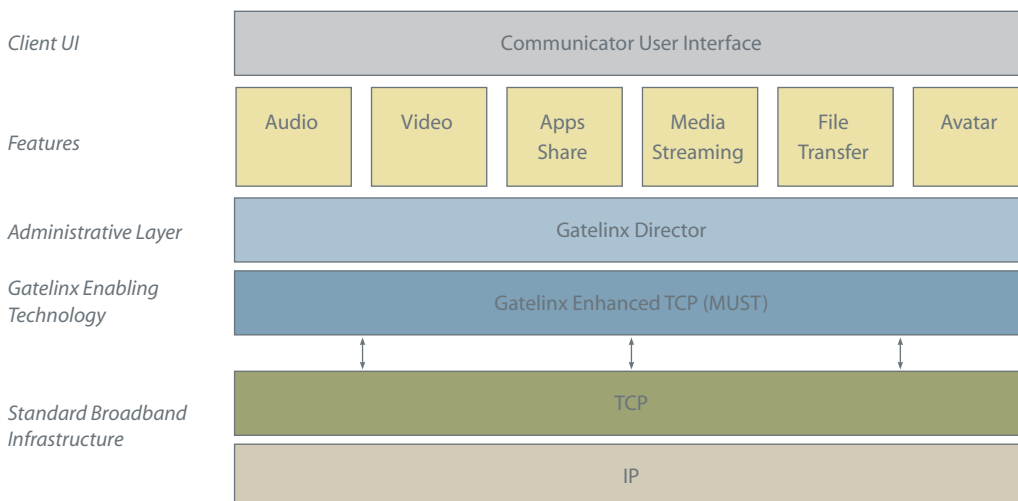

PARTNERING WITH GATELINX

Gatelinx is dedicated to assisting our partners in the development and delivery of branded IP multimedia services that create new markets, new customers, and new revenue streams—today. To learn how Gatelinx Communicator can support and extend your business, or to learn how you can become a Gatelinx partner, visit us at www.gatelinx.com or contact us at 877-669-4283 x1912.

ABOUT GATELINX

Gatelinx is the leading provider of innovative IP multimedia technologies that enable its partners to deliver branded IP multimedia solutions to retain customers and create revenue opportunities. Using the industry's first Enhanced TCP, Gatelinx radically reduces existing bandwidth requirements for the delivery of IP multimedia services while intelligently controlling packet loss and jitter. Our advanced, patent-pending technology enables providers and integrators of IP multimedia communications services and equipment to develop profitable, low-cost multimedia solutions of exceptional quality over existing IP communications infrastructures.
